

Review of Policies, Perspectives, and Expectations for Federal/State Collaboration in Western Water Resource Management (DRAFT)

Introduction

Need for Review

Challenges associated with water-resource management continue to increase, particularly in the West. Such factors as a demographic shift in our population, climate variability (including the potential for severe and sustained droughts), climate change, water-rights issues, depletion of groundwater in storage, introduction of new water storage and water-use technologies, and protection of endangered species, add to a growing complexity for resource management ([Anderson and Woosley, 2005](#)).
